anti-inflammatory agent

Tanti-inflammatory agent

The season of present sequence represents an analogue, MCP-1 (11-76), of monocyte

The present sequence represents an analogue, MCP-1 (11-76), of monocyte

Commontaretant protein-1 (MCP-1), acts as an antagonist of MCP-1

The analogue is useful as an anti-inflammatory agent to block

The effects of MCP-1 which is an inflammatory mediator causing migration

The effects of MCP-1 which is an inflammatory mediator causing migration

The effects of MCP-1 which is an inflammatory agent to block

The effects of MCP-1 which is an inflammatory agent to block

The effects of MCP-1 which is an inflammatory agent to block

The effects of MCP-1 which is an inflammatory agent to block

The effects of MCP-1 which is an inflammatory agent to block

The effects of MCP-1 which is an inflammatory and inflammatory diseases e.g. arthritis, arteriosclerosis and chronic

The analogue competes more effectively with MCP-1 for binding

The providing 50% inhibition of binding at a 25:1 ratio or less, compared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     anti-inflammatory agent
Claim 7: Page 5: 27pp; English.
The present sequence represents an analogue, MCP-1 (9-76), of monocyte
chemoattractant protein-1 (MCP-1). The analogue, which lacks the
                                                                                                                                                                                                                                                                                                                                                                                                         N-terminally truncated monocyte chemo:attractant protein-1 (MCP-1) - lacks MCP-1 activity and inhibits receptor binding, useful as
                                                                                                                                                                Monocyte chemoattractant protein analogue MCP-1 (11-76). Truncated monocyte chemoattractant protein-1; inhibitor; receptor binding; anti inflammatory; basophil; lymphocyte; allergy; chronic inflammatory disease; arthritis; arteriosclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The anti-inflammatory agent as a nantagonist of MCP-1 as thacks wor-1 biological activity and inhibits binding to a MCP-1 anti-inflammatory agent to block as the effects of MCP-1 which is an inflammatory mediator causing migration and monocytes and other cells e.g. basophils and lymphocytes into inflammatory diseases e.g. arthritis, arteriosclerosis and chronic alseases. The analogue competes more effectively with MCP-1 for binding providing 50% inhibition of binding at a 25:1 ratio or less, compared Sequence 69 AA;
N-terminal amino acids 1-8 of MCP-1, acts as an antagonist of MCP-1 receptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration of monocytes and other cells e.g. basophils and lymphocytes into inflammatory adiators into inflammatory diseases. The analogue competes more than the inflammatory diseases e.g. arthritis, arteriosclerosis and several lung MCP-1 receptors than prior art mutant versions of MCP-1 for binding providing 50% inhibition of binding at a 25:1 ratio or less, compared Sequence 68 AA;
                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Human monocyte chemo-attractant protein-1 (MCP-1) derivs. - are randogenous MCP-1 and can be used to treat restenosis endogenous MCP-1 and can be used to treat restenosis endogenous MCP-1 and can be used to treat restenosis endogenous MCP-1 and can be used to treat restenosis endogenous MCP-1; Page 11; 22pp; English.

Sometime of the protein of the monocyte chemoattractant activity of endogenous chart they inhibit the monocyte chemoattractant activity of endogenous that they inhibit the monocyte chemoattractant activity of endogenous chart they inhibit the monocyte chemoattractant activity of endogenous mCP-1, provided that the derivative has not been modified by the substitution of 28 Tyr by Leu and/or 30-Arg by Val. Preferred mutations can be the present sequence is a specifically claimed human MCP-1 acids 2-8. The present sequence is a specifically claimed human MCP-1 acids 2-8. The present sequence is a specifically claimed human MCP-1 acids 2-8. The present protein disclosed in Rollins, Molecular derivative based on the parent protein disclosed in Rollins, Molecular Can Present endogenous and Cellular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Anti-sense Monocyte Chemotactic Protein-1 oligo:nucleotide(s) -
Anti-sense Monocyte Chagnosis of restenosis, etc.
Disclosure: Column 13-14; 16pp; English.
This is the amino acid sequence of the human monocyte chemoattractant
This is the amino acid sequence of the human monocyte chemoattractant
This is the amino acid sequence of the human monocyte chemoattractant
This is monocyte chemotaxis and is produced by injured vascular
stimulator of monocyte chemotaxis and is produced by injured vascular
smooth cells thus attracting monocytes and macrophages which infiltrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

PT capable of inhibiting the monocyte chemo-attractant activity of endogenous MCP-1 and can be used to treat restenosis

Calma 3: Page 11: 22pp; English.

Comocyte chemoattractant protein-1 (MCP-1) derivatives are mutated such that they inhibit the monocyte chemoattractant activity of endogenous constitution of 28-Tyr by Leu and/or 30-Arg by Val. Preferred mutations care: (1) substitution of 28-Tyr by Leu and/or 30-Arg by Val. Preferred mutations of 24 pp. Ph; (3) substitution of 3-Asp by Ala; and/or (4) deletion of amino acids 2-8. The present sequence is a specifically claimed human MCP-1 and Callular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989.

The peptides can be used to prevent restenosis, e.g. in patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                targetted delivery of radioactive agent
Example 10: Column 19-20: 15pp: English.
Wall31 represents mature human monocyte chemoattractant protein-1
Wall31 represents mature human monocyte chemoattractant protein-1
(MCP-1). MCP-1 was radionuclide labelled and used in a method for
imaging a target site in vivo in an animal. Labelled MCP-1 was allowed
to accumulate at a target site (having MCP-1 receptors) in the animal
chemokine carrying either iodine-123 or iodine-131 can be used in the
method. Especially preferred is neutrophil activating peptide-2 (NAP-2)
which recognises interleukin-8 receptors and is labelled with
The method can be used for imaging a site of infection, inflammation,
accommon a significant or restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mature human monocyte chemoattractant protein-1 (MCP-1).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a monocyte chemoattractant peptide (MCP) The present sequence represents a monocyte chemoattractant peptide (MCP) are present sequence represents and peripheral blood mononclear U-105MG (e.g. present sequence) and peripheral blood mononclear up-105MG (e.g. present sequence) and peripheral blood mononclear in humans. Short peptides derived from MCPs can be screened to identify those that can bind to the monocyte receptor without stimulating a chemotactic response. These are potentially useful for treating inflammation associated with monocyte infiltration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

Disclosure; Page 12; 22pp; Japanese.
The invention relates to a new remedy for curing wounds which, instead of comprising a growth factor, comprises a monocyte chemotactic activating factor (WARF) or its variants or derivatives. The factor has potent effect on skin wounds and ulcers. The present sequence is human MCAF, the activity of which is exemplified as the new remedy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "Arg in the native sequence is replaced by Phe"

The sequences given in R53398-99 represent sense and antisense monocyte chemotactic protein-1 (MCP-1) respectively. These monocyte chemotactic protein-1 (MCP-1) respectively. These oligonotic of the analyse of a protein of vascular restenosis. The treatment of vascular restenosis.

Radiolabelled antisense MCP-1 compounds may be constructed using high energy alpha or beta emitting isotopes rather than the gamma energy alpha or beta emitting isotopes rather than the gamma emitters cutomarily used for diagnostic purposes. Antisense MCP-1 compounds inactivate MCP-1 or inhibit production of MCP-1 so that monocytes are not attracted to the area of vascular injury and proliferation of vascular cells is inhibited.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       05-MAR-1996 (first entry)
Monocyte chemotactic activating factor for use as wound remedy.
monocyte chemotactic activating factor; MCAF; wound remedy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Pollins B, Zhang YJ;

Proposed Part Received Tractant protein-1 (MCP-1) derivs. - are human moncoyte chemo-attractant protein-1 (MCP-1) derivs. - are radogenous MCP-1 and can be used to treat restenosis.

Prodogenous MCP-1 and can be used to treat restenosis.

Claim 5: Page 11: 22pp: English.

CC Amoncyte chemoattractant protein-1 (MCP-1) derivative are mutated such that they inhibit the moncyte chemoattractant activity of endogenous wCP-1, provided that the derivative has not been modified by the wCP-1, provided that the derivative has not been modified by the are: (1) substitution of 28 Tyr by an and/or (4) deletion of 24 Arg can (5) substitution of 28 Tyr by a specifically claimed human MCP-1 (5) substitution of 3-Asp by Ala: and/or (4) deletion of amino callular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989.

CC acids 2-8 The present sequence is a specifically claimed human MCP-1 (5) and cellular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989.

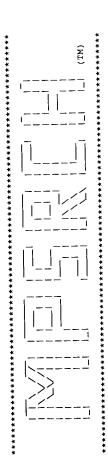

CC and cellular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989.

CC and cellular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989.

CC and cellular Biology, Vol. 9, No. 11, pp. 4687-4695, Nov. 1989.

CC and cellular Biology, Noi. 9, Nov. 1989.

Statistics: Mean 26.343; Variance 33.254; scale 0.792

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CHANG Y.-F., SUMMERS B.A., ERB H.N., APPEL M.J.;
"Borrelia burgdorferi migrates into joint capsules and causes an upregulation of interleukin-8 in synovial membranes of dogs experimentally infected with ticks.";
INFECT. IMMUN 65:1273-1285(1997).
-1- FUNCTION: IL-8 IS A CHEMOTANCTIC FACTOR THAT ATTRACTS NEUTROPHILS, IS A CHEMOTANDE TO MONCOYTES. IT IS ALSO INVOLVED IN BASOPHILS, AND T-CELLS, BUT NOT MONCOYTES. IT IS ALSO INVOLVED IN RESPONSE TO AN INFLAMMATORY STIMULUS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SEQUENCE FROM N.A.

                                                                                               porcine alveolar macrophages."

J. BALOL. CHEM. 266:18455-8463(1991).

-1- FUNCTION: IL-8 IS A CHEMOACTIC FACTOR THAT ATTRACTS NEUTROPHILS,
BASOPHILS, AND T-CELLS, BUT NOT MONOCYTES. IT IS ALSO INVOLVED IN
RESPONSE TO AN INFLAMMATORY STIMULUS.

-1- SUBUNIT: HOMODIMER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         YOSHIMURA T., JOHNSON D.G., "CDNA cloning and expression of guinea pig neutrophil attractant protein-1 (NAP-1). 1. FUNCTION: CHEMOTACTIC FACTOR THAT ATTRACTS MONOCYTES, LYMPHOCYTES,
1. FUNCTION: CHEMOTACTIC FACTOR THAT ATTRACTS MONOCYTES, LYMPHOCYTES,
CCR2B AND ECR3 RECEPTORS. PLAYS A ROLE IN THE ACCUMILATION OF
LEGNCOYTES AT BOTH SIDES OF ALLERGIC AND NONALLERGIC INFLAMMATION.
MAY BE INVOLVED IN THE RECRUITMENT OF MONOCYTES INTO THE ARTERIAL
WALL DURING THE DISEASE PROCESS OF ARTHEROSCLEROSIS. MAY PLAY A
ROLE IN THE MONOCYTE ATTRACTION IN TISSUES CHRONICALLY EXPOSED TO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Human strongal cell-derived chemokine, SDF-1 - useful for treating
human strongal cell-derived chemokine, SDF-1 - useful for treating
human immunodeficiency virus infection

Claim 2; Page 29; 48pp; French.

The invention relates to peptides which bind to a cellular receptor for
CXC chemokines in namely the CXCX4 receptor (also known as leukocyteexpressed transmembrane domain receptor), especially where the
peptide is human chemokine SDF-1. The peptide can be used to treat or
prevent HIV infections, optionally together with reverse transcriptase
inhibitors, viral protease inhibitors, soluble CD4 receptors, CD4
receptor antagonists, immunotherapy agents, agents for treating HIVassociated opportunistic infections and/or other CXC or Cc chemokines,
especially RANTES, MIP1- alpha, MIP1- beta or MCP1. The peptide can be
used to detect anti-SDF-1 antibodies in biological fluids. This
sequence represents a specifically claimed peptide which binds to the ö W50760; 27-JUL-1998 (first entry) Peptide which binds to CXCR4 receptor and is useful for treating HIV. Human strongal cell-derived chemokine, SDF-1 - useful for treating human strongal cell-derived chemokine, SDF-1 - useful for treating claim 5; Page 29; 48pp; French.

The invention relates to peptides which bind to a cellular receptor for expressed transmembrane domain receptor (also known as leukoyte-corp. The invention relates to peptide such as leukoyte-corp. The invention chemokine SDF-1. The peptide can be used to treat or prevent HIV infections, optionally together with reverse transcriptase inhibitors, viral protease inhibitors, soluble CD4 receptors, CD4 associated opportunistic infections and/or other CXC or CC chemokines, especially RANTES, MIPI- alpha, MIPI- beta or MCPI. The peptide can be sequence represents a specifically claimed peptide which binds to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Arenzana SF, Baggiolini M, Clark LI, Moser B, Virelizier JL;

Human stronal cell-derived chemokine, SDF-1 - useful for treating human immunodeficiency virus infection

PS Claim 5; Page 29; 48pp; French.

CX Chemokines, namely the CXCR4 receptor (also known as leukocyterory chemokines, namely the CXCR4 receptor; especially where the expressed transmembrane domain receptor), especially where the peptide is human chemokine SDF-1. The peptide can be used to treat or prevent HIV infections, optionally together with reverse transcriptase inhibitors, viral protease inhibitors, soluble CD4 receptors, CD4 associated opportunistic infections and/or other CXC or CC chemokines, especially RANTES, MIPI- alpha, MIPI- beta or MCPI. The peptide can be sequence represents a specifically claimed peptide which binds to the contraction and contractions and contractions in the contraction of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Claim 5; Page 29; 48pp; French.
CC chemokines, namely the CXCR4 receptor (also known as leukocyte-expressed transmembrae domain receptor), especially where the peptide is human chemokine SDF-1. The peptide can be used to treat or prevent HIV infections, optionally together with reverse transcriptase inhibitors, viral protease inhibitors, soluble CD4 receptors, CD4 associated opportunistic infections and/or other CXC or CC chemokines, especially RANTES, MIP1- alpha, MIP1- beta or MCP1. The peptide can be used to detect anti-SDF-1 antibodies in biological fluids. This
                                                                                                                                                                                                               27-JUL-1998 (first entry)
Peptide which binds to CXCR4 receptor and is useful for treating HIV.
Stromal cell-derived chemokine; SDF-1; human immunodeficiency virus;
HIV; CXCR4 receptor; leukocyte-expressed transmembrane domain receptor.

     Human stromal cell-derived chemokine, SDF-1 - useful for treating thuman stromal cell-derived chemokine, SDF-1 - useful for treating pT human immunodeficiency virus infection

PT claim 10: page 30: 48Pp; French.

CC The invention relates to peptides which bind to a cellular receptor for the invention relates to peptides which bind to a sellular receptor (CC chemokines, namely the CXCR4 receptor), especially where the expressed transmembrane domain receptor), especially where the peptide is human chemokine SDF-1. The peptide can be used to treat or peptide is human chemokine SDF-1. The peptide can be used to treating HIV-creeptor antagonists, immunotherapy agents, agents for treating HIV-creeptor antagonists, immunotherapy agents, agents for treating HIV-creeptor antagonists, immunotherapy agents, or ther CXC or CC chemokines, associated opportunistic infections and/or other CXC or CC chemokines, cspecially RANTES, MTP1-alpha , MTP1-beta or MCP1. The peptides used to detect anti-SDF-1 antibodies in biological fluids. Peptides used to identical amino acid residues to W50760 with the exception of the correct or agences W50764-5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Protein encoded by cDNA derived from mouse stroma; cell line; ST2; primer; polymerase chain reaction; amplify; PCR; linker; plasmid; expression vector; pSRT; infection; transformation; E.coli DH5 alpha; cDNA library; signal peptide;
                             Claim 2; Page 22; 43pp; English.

A cDNA library prepared from human pro-B cell line FLEB14 cells was a corecand with 32P-labeled mouse SDF-1-alpha cDNA.

A positive clone sorteined an insert of 1.9 kb (0.74089), including an ORF (0.74088) encoding human SDF-1-alpha (R75419). Recombinant hSDF-1-alpha was produced in E. coll and COS cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               by fractionated. The CDNA was then ligated into a plasmid obtd. by digestion of the expression vector, pSRT. After transformation of an digestion of the expression vector, pSRT. After transformation of an E.coli DH5 alpha strain, a cDNA library having selectivity for signal peptides was obtained. The protein encoded by the isolated sequence is a useful agent in the treatment or prevention of anaemia, leukopaenia or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Stromal cell-derived chemokine; SDF-1; human immunodeficiency virus; HIV; CXCR4 receptor; leukocyte-expressed transmembrane domain receptor.

PT Human strongl cell-derived chemokine, SDF-1 - useful for treating
Thuman immunodeficiency virus infection
Claim 4; Figure 5; 48pp; French.
CC The invention relates to peptides which bind to a cellular receptor (acc cxc chemokines, namely the CXCR4 receptor (also known as leukocytec cxpressed transmembrane domain receptor), especially where the peptide is human chemokine SDF-1. The peptide can be used to treat or inhibitors, viral protease inhibitors, soluble CD4 receptors transcriptase associated opportunistic infections and/or other CXC or CC chemokines, especially RANTES, MIP1- alpha, MIP1- beta or MCP1. The peptide can be seed to treat or sequence receptor antagonists, immunotherapy agents, agents for treating HIV-cspecially RANTES, MIP1- alpha, MIP1- beta or MCP1. The peptide can be sequence epresents human SDF-1.
                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                          P.J.UJ-1998 (first entry)
Human SDF-1 which is useful for treating HIV.
Stromal cell-derived chemckine; SDF-1; human immunodeficiency virus;
HIV: CXCR4 receptor; leukocyte-expressed transmembrane domain receptor.
                                                                                                                                                                                                                     Gaps
      identical amino acid residues to W50760 with the exception of the sequences W50764-5.

PT Chantactic Introduction to the terologous polypeptide, used for, e.g. Chaim 14c; Page 45-46; 69pp; English, used for, e.g. Chaim 14c; Page 45-46; 69pp; English.

Construct comprising an isolated polypuclectide encoding a chimeric construct comprising an isolated polypuclectide encoding a chimeric construct comprises at least 1 chemokine polypeptide covalently better the construction, the chimeric polypeptide covalently will have longer and increased biological activity and can direct the chemokine to a particular site. The chimeric polypeptides can also be designed to inhibit or desensitise chemokine receptors. They can be used to affect the Chemotactic recruitment of migratory cells, e.g. for cartilage, ligament or tendon, for recruiting transplanted bone marrow contributing anglogenesis. for respendenting or bone marrow contributing anglogenesis. for respendenting inflammatory or calls to bone marrow or for treating or preventing inflammatory or preventing HTV infection. Neutralising antibodies binding to the chimeric contributions and so be used as vaccine adjuvants or to polypeptide may also be useful therapeutics for both conditions concernated with the chemokine corresponding to the chimmeric concernation of propertide and also in the treatment of some forms of secure where abnormal expression of the chemokine is involved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           02-DEC-1998 (first entry)
Human chemokine SDF-lalpha domain protein from clone SK2-2.
Chemokine; SDF-lalpha, chimeric; human; heterologous protein; inhibitor; receptor; chemotaxis; migratory cell; amgiogenesis; bone; regeneration; autoimmune disorder; vaccine adjuvant; antigen presenting; HIV; human immunodeficiency virus; therapy; prevention.
            Polypeptide(s) used for treating diseases relating to undergrown or diseases, infections diseases, AIDS or neuro: degenerative diseases, Claim 12: page 26-27; 43pp; English.

A cDNA library prepared from human pro-B cell line FLEB14 cells was contained an insert of 3.5 kb (074091), including an OBF (274090) produced in E. coli and COS cells.
                                                                                                                                                                                                                                                                                        0; Gaps

recould noncottactic factor type polypeptide and DNA Human monocyte chemotactic factor type polypeptide and DNA Human monocyte chemotactic factor type polypeptide and antitumour agents.

The sequence was deduced from the DNA sequence determined from the execumbinant plasmids, PHMCF7, PHMCF25 and PHMCF29 which three recombinant plasmids, PHMCF7, PHMCF25 and PHMCF29 which three recombinant plasmids phwCF7, PHMCF29 bases 105 and 226 were isolated from a cDNA library prepd. from RNA extracted from were isolated from a cDNA library prepd. from RNA extracted from were isolated from promyclolaries and library prepd. from RNA extracted from the promyclolaries promyclolaries and phwCF29 bases 105 and 226 were cectors. In plasmids PHWCF7 and PHWCF29 bases 105 and 226 were to extensive protein is therefore not determined and may be of the precursor protein may be produced by recombinant contrain bacterial infectons and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     07-NOV-1997 (first entry)
07-NOV-1997 (first entry)
monocyte chemoattractant protein analogue MCP-1 (10-76).
Truncated monocyte chemoattractant protein-1; inhibitor;
receptor binding; anti inflammatory; basophil; lymphocyte; allergy; chronic inflammatory disease; arthritis; arteriosclerosis;
associated with the chemokine corresponding to the chemokine domain of the chimeric polypeptide and also in the treatment of some forms of cancer where apportmal expression of the chemokine is involved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human MCF precursor.

New chimeric polypeptide(s) - comprise chemokine polypeptide

New chimeric polypeptide(s) - comprise chemokine polypeptide

Tovalently linked to heterologous polypeptide, used for, e.g.

chemotactic recruitment of migratory cells

Signalish.

Ca finis sequence represents a human chemokine SDF-lalpha domain, isolated

C from cDNA clones S1-2 and S1-3. This sequence is used in the production

from cDNA clones S1-2 and s1-3. This sequence is used in the production

c from cDNA clones S1-2 and s1-3. This sequence is used in the production

c datached to at least 1 heterologous polypeptide. By including a chimeric comparable protein in the construction, the chimeric polypeptides can also be comparable to a particular site. The chimeric polypeptides can also be commokine to a particular site. The chimeric polypeptides can also be commokine to a particular site. The chimeric polypeptides can also be configured to inhibit or desensitise chemokine receptors. They can be used designed to inhibit or desensitise chemokine receptors. They can be used catillate, ligament or tendon, for recruiting transplanted bone marrow cartilage, ligament or tendon, for recruiting transplanted bone marrow cartilage, ligament or tendon, for recruiting inflammatory or cells to bone marrow, or for treating or preventing inflammatory or cells to bone marrow, or for treating or preventing inflammatory or cells to bone marrow, or for treating cells and for treating or cenhance the activity of antigen presenting cells and for treating or cenhance the activity of antigen presenting antibodies binding to the chimeric polypeptide may also be useful therapeutics for both conditions
                                                                                                                                                                                                                                                                                                                                                     02-DEC-1998 (first entry)
Human chemokine SDF-lalpha domain protein from clones SI-2/SI-3.
Human chemokine, SDF-lalpha: chimeric; human; heterologous protein; inhibitor; chemokine; SDF-lalpha: chimeric; human; heterologous protein; regeneration; receptor; chemotaxis; migratory cell; angiogenesis; bone; regeneration; receptor; chemotaxis; chemom; bone marrow; transplant; inflammation; autoimmune disorder; vaccine adjuvant; antigen presenting cell; cancer; HIV; human immunodeficiency virus; therapy; prevention.

Chemoatractarant protein-1 (MCP-1). The analogue, Which lacks the chemoatractarant protein-1 (MCP-1). The analogue, which lacks the chemoatractarant protein-1 (MCP-1). The analogue, which lacks the as in lacks MCP-1 biological activity and inhibits binding to a MCP-1 receptor. The analogue is useful as an anti-inflammatory agent to block the effects of MCP-1 which is an inflammatory mediator causing migration inflammatory mediator causing migration inflammatory diseases. MCP-1 has been implicated in allergic and chronic cinflammatory diseases e.g. arthritis, arteriosclerosis and chronic diseases. The analogue competes more effectively with MCP-1 for binding MCP-1 receptors than prior art mutant versions of MCP-1 e.g. preferably cut with 75:1 for prior art mutant 7ND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents an analogue, MCP-1 (11-76), of monocyte chemoattractant protein-1 (MCP-1). The analogue, which lacks the chemoattractant protein-1 (MCP-1). The analogue, which lacks the as it lacks MCP-1 biological activity and inhibits binding to a MCP-1 receptor. The analogue is useful as an anti-inflammatory agent to block of monocytes and other cells e.g. basophils and lymphocytes into inflammation sites. MCP-1 has been implicated in altergic and chronic diseases. The analogue competes more effectively with MCP-1 ceptors than prior art mutant versions of MCP-1 e.g. providing 50% inhibition of binding at a 25:1 ratio or less, compared 50 Sequence 67 AA;
                                                                                      N-terminally truncated monocyte chemo:attractant protein-1 (MCP-1) lacks MCP-1 activity and inhibits receptor binding, useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N-terminally truncated monocyte chemo:attractant protein-1 (MCP-1) - lacks MCP-1 activity and inhibits receptor binding, useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Monocyte chemoattractant protein analogue MCP-1 (11-76). Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 26.183; Variance 34.228; scale 0.765

-1- FUNCTION: IL-8 IS A CHEMOTACTIC FACTOR THAT ATTRACTS NEUTROPHILS,
BASOPHILS, AND T-CELLS, BAIN NOT MONOCYTES. IT IS ALSO INVOLVED IN
NEUTROPHIL ACTIVATION. IT IS RELEASED FROM SEVERAL CELL TYPES IN
RESPONSE TO AN INFLAMMATORY STIMULUS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               porcine alveolar macrophages ";
J. BIOL. CHEM. 26:8455-8463(1991).
-!- FUNCTION: IL-8 IS A CHEMOTACTIC FACTOR THAT ATTRACTS NEUTROPHILS,
-BASOPHILS, AND T-CELLS, BUT NOT MONOCYTES. IT IS ALSO INVOLVED IN
RESPONSE TO AN INFLAMMATORY STIMULUS.
-!- SUBUNIT: HOMODIMER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TISSUE-LUNG;

FOUNTION: CHEMOTACTIC FACTOR THAT ATTRACTS MONOCYTES AND BASOPHILS ACTIVITY. HAS BEEN IMPLICATED IN THE PATHOGENESIS OF DISBASES CHARACTERIZED BY MONOCYTIC INFILTRATES, LIKE PSORIASIS, RHEUMATOID ARTHRITIS OR ATHEROSCLEROSIS. MAY BE INVOLVED IN THE RECRUITMENT OF MONOCYTES INTO THE ARTERIAL WALL DURING THE DISEASE PROCESS OF
                                                                                                                                                          ROBINSON E.A., YOSHIMURA T., LEONARD E.J., TANAKA S., GRIFFIN P.R., SHABANOWITZ J., HUNT D.F., APPELLA E., "Complete amino acid sequence of a human monocyte chemoattractant, a putative mediator of cellular immune reactions."; PROC. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Mean 25.485; Variance 37.640; scale 0.677 Statistics:
